

Amendment

Kindly amend the claims as follows:

1. (previously presented) Apparatus for moving particles entrained in a first fluid to a second fluid comprising: a conduit defined by a first wall and a second opposite wall, the conduit in communication with a first inlet and a first outlet for the first fluid, one of the walls comprising a second inlet and a second outlet to the conduit for the second fluid, and means capable of generating a stationary standing sound wave having a pressure node disposed within the conduit, such means comprising the first wall of the conduit configured to generate and transmit a sound wave and the second opposite wall of the conduit adapted to reflect the generated sound wave.
2. (previously presented) Apparatus according to Claim 1, in which the apparatus minimizes mixing between the two fluids by providing contacting laminar flow of each fluid.
3. (cancelled)
4. (previously presented) Apparatus according to Claim 1, in which the first inlet and the first outlet are orthogonal to the second inlet and the second outlet.

5. (previously presented) Apparatus according to Claim 1, in which the pressure node is centrally disposed along the longitudinal length of the conduit.
6. (cancelled)
7. (previously presented) Apparatus according to Claim 1, in which the first wall of the conduit comprises a piezoceramic material.
8. (original) Apparatus according to Claim 7, in which the piezoceramic material is associated with an alternating potential source.
9. (withdrawn) A method of moving particles from in a first fluid to a second fluid, comprising the steps of i) providing for contacting laminar flow of each fluid within a conduit having means capable of generating a standing sound wave and ii) generating a standing sound wave having a pressure node within the conduit.
10. (withdrawn) A method of washing particles according to Claim 9.
11. (withdrawn) A method of mixing samples according to Claim 9.
- 12.-13. (cancelled)

14. (currently amended) Apparatus according to Claim 1, wherein the first inlet and the first outlet communicate with the second wall, and wherein the second inlet and the second outlet ~~communicate~~ withcontact the first wall.

15. (previously presented) Apparatus according to Claim 1 having only one transducer as part of the means capable of generating a stationary standing sound wave.

16. (previously presented) Apparatus according to Claim 15 in which the transducer comprises part of the first wall of the conduit.

17. (previously presented) Apparatus according to Claim 16 in which the first wall of the conduit has an outer surface defining a recess in which the transducer is provided.
